

Biomesotherapy levels

In Biomesotherapy, specifically selected drugs and biologically active substances are used to treat a wide range of aesthetic and medical conditions.

Some of the most commonly used substances in Biomesotherapy include:

Nucleic acids: Deoxyribonucleic acid (DNA) and ribonucleic acid (RNA), which can promote cellular regeneration and stimulate collagen and elastin production.

Peptides: Growth factors, which are biomimetic peptides, can enhance skin elasticity.

Hyaluronic acid: A compound naturally found in the skin that helps hydrate and plump tissue, improving both its appearance and function.

Amino acids: Such as lysine, arginine, and taurine, which are essential for collagen synthesis and skin health.

Enzymes: Such as bromelain and serrapeptase, which can help reduce inflammation, improve blood circulation, and enhance tissue trophism.

Antioxidants: Including vitamin C, vitamin E, and coenzyme Q10, which can protect the skin against free radical damage.

The selection of substances used in Biomesotherapy depends on the condition being treated, therapeutic goals, the specific needs of the patient, and, most importantly, the precision and expertise of the attending physician. It is essential that Biomesotherapy is performed by qualified and experienced professionals who are capable of tailoring the treatment to the individual and ensuring both its safety and effectiveness.

“True Biomesotherapy® exclusively uses Homeopathic Remedies in injectable form and enzymatic solutions obtained through cold extraction, which are subsequently rubbed into the treated areas after implantation and consumed daily throughout the treatment period, together with the appropriate oral Homeopathic Remedies.

This synergy, validated over decades of clinical practice, has not only proven to be the state of the art in injectable therapy but also holds such wide margins for improvement and research that they cannot currently be fully foreseen.

The use of multi-injection devices is essential in Biomesotherapy® (www.rimos.com), allowing for multiple simultaneous therapeutic actions—for example, the complex simultaneous stimulation of various specialized nerve endings (corpuscles).

I have come to realize that I have taken a step into the therapy of the future.”
